Emerging clinical fungi

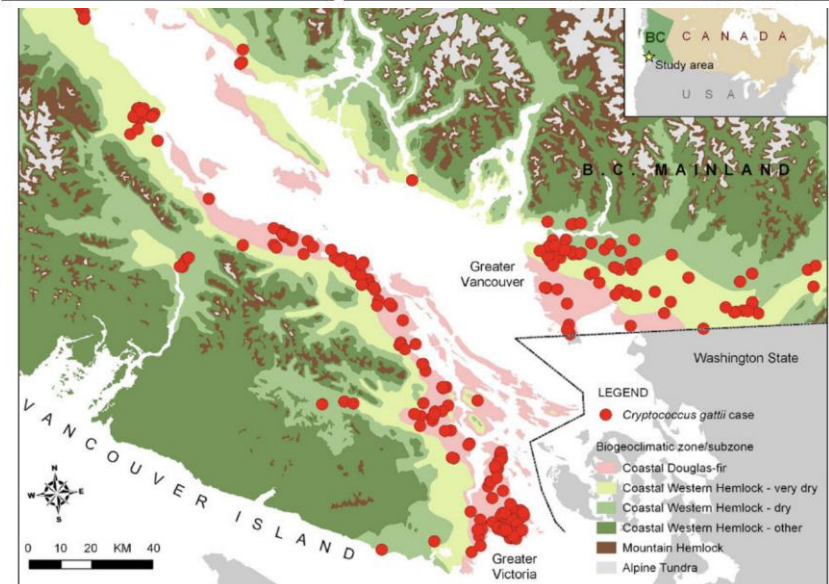

- **'emerging'**: According to Oxford Dictionary, means 'becoming apparent or prominent'.
- A new fungus is spotted at increasing frequency after its first discovery.
- Are we flooded by emerging pathogenic fungi?
- *Cryptococcus gattii*, *Candida auris*, *Trichophyton indotineae*, *Emergomyces africanus*, *Sporothrix brasiliensis*, *Pseudogymnoascus destructans*.

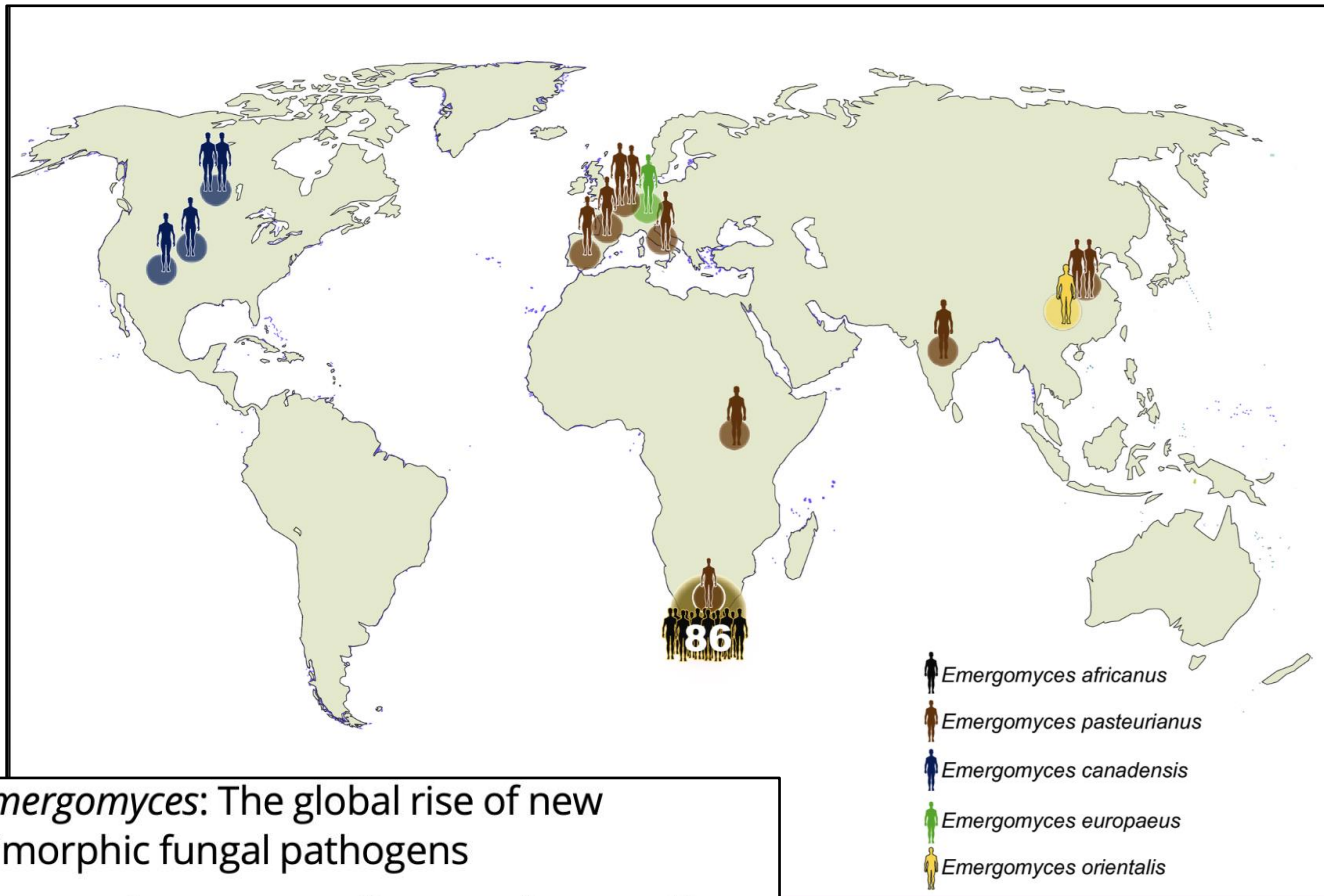

Global Daily Incident Cases of COVID-19

Emerging pathogen - *Cryptococcus gattii*

- Vancouver Island and British Columbia (1999)
- Pneumonia or meningitis 36 cases/million population/year.
- The fungus (resist, survive, dispersal) present in a high concentrations in the environment.

Emerging pathogens - *Emergomyces*

- Link between osmotolerance / stress tolerance and pathogenicity.

Successful pathogens

- Able to grow at 37°C or above: Only 6% of species in environment can tolerate 37°C.

- *Saccharomyces cerevisiae* clinical isolates are able to grow at higher temperatures.

Successful pathogens

Sybren de Hoog^{2,3,6,14,15,16,17}

Successful pathogens

- Able to grow at 37°C or above.
 - Emergence of mammals as the dominant land species (endothermy and homeothermy).
(Casadevall: fungal infection-mammalian selection)
- Able to breakthrough the barriers and invade human host.
- Able to survive inside human body (lysis/absorption).
- Resist the immune system.

Fungal infections in humans

Burden of fungal diseases

- App. 6.5 million invasive fungal infections / year.
- Fungal disease mortality 3.8 million > **malaria** and **TB**.

Humans are not prepared for a pandemic caused by fungal infections

Changes in the environment and climate, as well as fungicide overuse in agriculture, have driven a rise in fungi capable of infecting people and evading the few drugs designed to fight them.
